1 Introduction

1.1 Purpose and Scope

The main purpose of the project plan is to plan time, cost and resources adequately to estimate the work needed and to effectively manage risk during project execution. A failure to adequately plan reduces the project's chances of successfully accomplishing its goals.

Project planning generally consists of:

- Identifying deliverables and creating the work breakdown structure;
- Identifying the activities needed to complete those deliverables and networking the activities in their logical sequence;
- Estimating the resource requirements for the activities;
- Estimating time and cost for activities;
- Developing the schedule;
- Developing the budget;
- Resource allocation (organization of work loads);
- Risk planning.

This document is based on an analysis made with two different algorithmic metrics of the system for *myTaxiService*. The first one is the Function Points (FP), which is used to estimate the software dimension (code size), which is directly used to evaluate the cost. The second is the COCOMO II that is used to estimate the efforts required in the development of a project by taking in account: characteristics of people, products and process.

1.2 List of Definitions and Abbreviations

The following acronyms are used in this document:

- FP: Function Points
- COCOMO: COnstructive COst MOdel
- ILF: Internal Logic File
- EIF: External Interface File
- PM: Person-Months
- SLOC: Source Lines of Code
- KSLOC: Thousands of SLOC
- SD: Scale Drivers

The following definitions are used in this document:

- Deliverables: are work that are delivered to the customer, e.g. a requirement document for the system.

2 Function Point analysis

2.1 Introduction

The Function Point estimation approach is based on the amount of functionalities in a software and their complexity. Indeed the effort to develop a software project grows with the number of external inputs and outputs, user interactions, files and interfaces used by the system; therefore a weight is associated to all these functionalities and the total effort is computed summing all the partial values.

The parameters used to perform this estimation are summarized in the following tables, taken from COCOMO II, Model Definition Manual at:

http://csse.usc.edu/csse/research/COCOMOII/cocomo2000.0/CII_modelman2000.0.pdf

This first schema is used to determine the complexity-level function counts. It classifies each functionality into Low, Average and High complexity levels.

Table 2. FP Counting Weights

For Internal Logical Files and External Interface Files			
Data Elements			
Record Elements	1 - 19	20 - 50	51+
1	Low	Low	Avg.
2 - 5	Low	Avg.	High
6+	Avg.	High	High

For External Output and External Inquiry			
Data Elements			
File Types	1 - 5	6 - 19	20+
0 or 1	Low	Low	Avg.
2 - 3	Low	Avg.	High
4+	Avg.	High	High

For External Input			
Data Elements			
File Types	1 - 4	5 - 15	16+
0 or 1	Low	Low	Avg.
2 - 3	Low	Avg.	High
3+	Avg.	High	High

This second one, defines the weights assigned to every level of complexity for all the FP types.

Table 3. UFP Complexity Weights

Function Type	Complexity-Weight		
	Low	Average	High
Internal Logical Files	7	10	15
External Interfaces Files	5	7	10
External Inputs	3	4	6
External Outputs	4	5	7
External Inquiries	3	4	6

Here is a brief explanation of the FP types:

- Internal Logic File: homogeneous set of data used and managed by the application
- External Interface File: homogeneous set of data used by the application but generated and maintained by other applications
- External Input: elementary operation to elaborate data coming from the external environment
- External Output: elementary operation that generates data for the external environment (it usually includes the elaboration of data from logic files)
- External Inquiry: Elementary operation that involves input and output (without significant elaboration of data from logic files)

2.2 FP types estimation

3 COCOMO II analysis

3.1 Introduction

This estimation is achieved through a complex, statistical model that takes in account the characteristics of the product but also of people and process. The result of this technique is the estimation of Person-Months required to develop the project.

The COCOMO II calculations are based on the estimated of the software dimension in source lines of code (SLOC).

4 Tasks identification and schedule

5 Resources allocation

6 Risk planning and management

8 Appendix

8.1 Software and tools used

- TeXstudio 2.10.6 (<http://www.texstudio.org/>) to redact and format this document.
- Astah Professional 7.0 (<http://astah.net/editions/professional>)

8.2 Hours of work

The time spent to redact this document:

- Baldassari Alessandro: 12 hours.
- Bendin Alberto: 12 hours.
- Giarola Francesco: 12 hours.
